Insight Data Management

Identify and review data to improve safety to your work site.

The importance of data management

Improving site safety and increasing awareness of potential incidents can be difficult, as near misses and areas of risk can easily go unreported and overlooked.

ZoneSafe Insight is a cloud based management system that works with all ZoneSafe systems to identify, monitor and log all site activity to enable easy analysis of potential incidents, including near-miss occurrences and high risk activities.

How Insight works

ZoneSafe Insight™ is a cloud based software system used by site managers and supervisors. The system enables them to make insightful and informed decisions relating to site safety.

The system provides users with essential information recorded by each ZoneSafe system and is displayed in a user friendly, graphical report format. This enables easy analysis of events and identification of incidents such as near-miss occurrences or high-risk activities.

Insight also has the ability to check battery levels, track personnel or vehicle movement, restrict access and more.
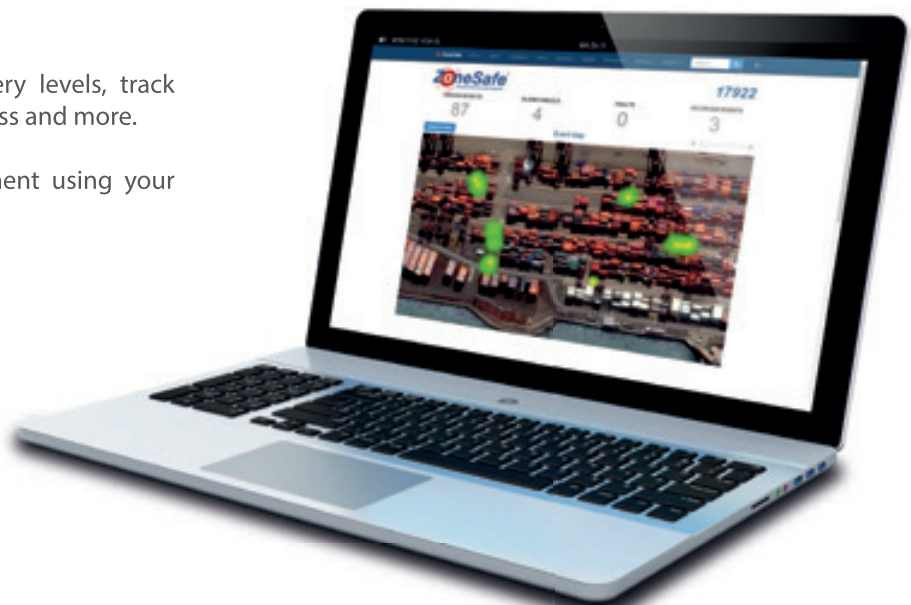

ZoneSafe Insight™ employs data management using your own WiFi network, and enables the user to:

- Identify, analyse and compare events
- Manage safety performance
- Log near-miss reporting
- Set up alerts
- Generate reports and share data
- Link with GPS location tracking module
- Link with other ZoneSafe applications
